Characterization of Porous Solids and Powders: Surface Area, Pore Size and Density

Volume 16 in the Particle Technology Series (PTS)
September 2006, 365 pp, hardbound

S. Lowell, Quantachrome Instruments, Boynton Beach, USA
Jene E. Shields, Dept. of Chemistry, Long Island University, CW Post Campus, Brookville, NY, USA
Martin A. Thomas, Quantachrome Instruments, Boynton Beach, USA
Matthias Thommes, Quantachrome Instruments, Boynton Beach, USA

This book gives a unique overview of principles associated with the characterization of solids with regard to their surface area, pore size and density. The book covers methods based on Gas Adsorption (Physi- and Chemisorption), Mercury Porosimetry and Pycnometry. Not only are the theoretical and experimental basics of these techniques described, but also the most recent developments, particularly in light of the tremendous progress made in recent years in Materials Science and Nanotechnology. The application of classical theories and methods for pore size analysis are discussed in contrast with the most advanced microscopic theories based on statistical mechanics (e.g. Density Functional Theory and Molecular Simulation). The book will appeal both to students and to scientists in industry who are in need of accurate and comprehensive pore and surface area characterization of their materials.

Review:
An updated version of the classical textbook (Powder Surface Area and Porosity, 3rd ed., 1991) by the first two authors "the book now includes recent developments in the areas of density functional theory, molecular simulations, pore network theories, and it has an expanded section on heterogeneous catalysts... An interesting aspect is the book's clear division between theoretical aspects (Part 1) and experimental aspects (Part 2) of the various techniques... The book also demonstrates a good balance between how deep a theoretical concept is being discussed and how many real-world examples are presented.

Summing up: Recommended. Lower-division undergraduates through professionals; two-year technical program students."

H. Glesche, Alfred University, In: CHOICE, May 2005, Vol. 42 No.09

Audience:
Students and scientists in industry in need of accurate and comprehensive pore and surface area characterization of their materials

TABLE of CONTENTS

PART 1 THEORETICAL

1. Introduction
2. Gas Adsorption
3. Adsorption Isotherms
4. Adsorption Mechanism
5. Surface Area from the Langmuir and BET Theories
6. Other Surface Area Methods
7. Evaluation of the Fractal Dimension by Gas Adsorption
8. Mesopore Analysis
9. Micropore Analysis
10. Mercury Porosimetry: Non-Wetting Liquid Penetration
11. Pore Size and Surface Characteristics of Porous Solids by Mercury Porosimetry
12. Chemisorption: site Specific Gas Adsorption

PART 2 EXPERIMENTAL

13. Physical Adsorption Measurements – Preliminaries
14. Vacuum Volumetric Measurements (Manometry)
15. Dynamic Flow Method
16. Volumetric Chemisorption: Catalyst Characterization by Static Methods
17. Dynamic Chemisorption: Catalyst Characterization by Flow Techniques
18. Mercury Porosimetry: Intra and Inter Particle Characterization
19. Density Measurement

INDEX

Characterization of Porous Solids and Powders: Surface Area, Pore Size and Density
